Nonlinearity  
Injection

Analysis

Conclusion

- ▶ Random numbers are fundamental to many cryptographic applications
  - ▶ used in stream ciphers, key generators and nonces
  - ▶ an ideal concept
- ▶ Usually approximated by PRNG
- ▶ Traditionally LFSR and LHCA were used as PRNG
  - ▶ can be readily analyzed compromising security
- ▶ As a solution *nonlinearity* was introduced
  - ▶ suffers from low periodicity
- ▶ Current PRNGs using FSRs or CAs are hard to alter dynamically

## Introduction

## Dynamic Construction of Maximum Length LHCA

## Nonlinearity Injection

## Analysis

## Conclusion

- ▶ In 1996, Cattell and Muzio presented a mapping between *irreducible* polynomial and LHCA
  - ▶ irreducible polynomial does not ensure maximum periodicity of LHCA
- ▶ There exists one-to-one correspondence between *primitive* polynomial and maximum-length LHCA
  - ▶ maps finding maximum-length LHCA to that of finding primitive polynomial
- ▶ However, checking of primitivity is too costly
  - ▶ requires factorization of  $2^n - 1$
  - ▶ requires checking primitive root of the defining polynomial, necessitating exponentiation

# Dynamic Construction of Maximum Length LHCA

Introduction

Dynamic  
Construction  
of Maximum  
Length LHCA

Nonlinearity  
Injection

Analysis

Conclusion

## Theorem 1

*If  $2^n - 1$  is a prime number (Mersenne Prime) then every degree  $n$  irreducible polynomial is also primitive*

- ▶ Finding primitive polynomial changes to finding irreducible polynomial
- ▶ Work with polynomials of degree  $n : 2^n - 1 \in \mathbb{P}$

# Dynamic Construction of Maximum Length LHCA

## Introduction

## Dynamic Construction of Maximum Length LHCA

## Nonlinearity Injection

## Analysis

## Conclusion

- ▶ A polynomial  $f(x) = \sum b_i \cdot x^i, 0 \leq i \leq n$  is represented as a bit-string  $b_n, b_{n-1}, \dots, b_0$
- ▶ Random patterns of  $(n - 1)$  bits with 1 added at both ends are produced
  - ▶ MSB is 1 as  $f(x)$  is monic
  - ▶ LSB also should be 1, otherwise  $x$  will be a trivial factor of  $f(x)$
- ▶ Finally,  $f(x)$  is subjected to Rabin's irreducibility test

# Dynamic Construction of Maximum Length LHCA

Conclusion

## Algorithm 1: Generation of maximum length LHCA

**Input:** An initial seed  $r$

**Output:** A maximum length LHCA rule Vector

```
1:  $s \leftarrow \text{RAND}(r)$ 
2:  $\mathcal{S} \leftarrow 1||s||1$ 
3: while  $\text{ISIRREDUCIBLE}(\mathcal{S}) = \text{FALSE}$  do                                ▷ Rabin's Test
4:    $s \leftarrow \text{RAND}(s)$ 
5:    $\mathcal{S} \leftarrow 1||s||1$ 
6: end while
7:  $rule \leftarrow \text{SYTHESIZECA}(\mathcal{S})$ 
8: return  $rule$ 
```

Nonlinearity  
Injection

Analysis

Conclusion

## Theorem 2

*The expected running time of Algorithm 1 is  $\mathcal{O}(n)$ .*

- ▶ Number of irreducible polynomials of degree  $n$  over  $\mathbb{F}_q$   
$$I_n = \frac{1}{n} \sum_{k|n} \mu(k) q^{n/k}, \quad \mu \rightarrow \text{Möbius function}$$
- ▶ Follows that  $q^n - 2q^{n/2} \leq nI_n \leq q^n$
- ▶ A fraction very close to  $\frac{1}{n}$  are irreducible
- ▶ On average Algorithm 1 produces an irreducible polynomial with  $n$  number of trials

Length LHCA

Nonlinearity  
Injection

Analysis

Conclusion

- ▶ A maximum length LHCA is converted to a maximum length NHCA
- ▶ Nonlinear functions are injected into selected positions of the LHCA
- ▶ Maximum length property is ensured with additional boolean functions
- ▶ A term *shifting operation* is defined for this purpose

# Nonlinearity Injection

Introduction

Dynamic  
Construction  
of Maximum  
Length LHCA

Nonlinearity  
Injection

Analysis

Conclusion

## Definition 1

The one cell shifting operation, denoted by  $f_i \xrightarrow{P} f_{i\pm 1}$  moves a set of ANF monomials  $P$  from  $i$ -th cell of an NHCA to all the cells from  $(i-1)$  to  $(i+1)$ -th cell, according to the dependency of the affected cells upon the  $i$ -th cell. Each variables in  $P$  is changed by their previous state. Similarly, a  $k$  cell shifting is obtained by applying the one cell shifting operation for  $k$  times upon the initial NHCA and symbolized as  $f_i \xrightarrow{P} f_{i\pm k}$ .

Analysis

Conclusion

## Algorithm 2: NHCA synthesis

**Input:** A maximum length LHCA with ruleset  $\mathcal{F}_L$ , A position  $j$  to inject non-linearity and the set of cells of the LHCA  $\mathcal{S}$

**Output:** A maximum length NHCA ruleset  $\mathcal{F}_N$

1:  $\mathcal{F}_N \leftarrow \mathcal{F}_L$

2: Let  $\mathcal{F}_N = \{f_{n-1}, \dots, f_0\}$

3:  $\mathcal{X} \subset \mathcal{S} : \forall x \in \mathcal{X}, x \notin \mathbf{N}(j)$

▷ select a subset from  $\mathcal{S}$

4:  $P \leftarrow \mathbf{f}_N(\mathcal{X})$

▷  $\mathbf{f}_N$  is non-linear function

5:  $f_j \leftarrow f_j \oplus P$

6:  $(f_j \xrightarrow{P} f_{j+1})$

▷ Apply shifting operation

7:  $f_j \leftarrow f_j \oplus P$

8: **return**  $\mathcal{F}_N$

# Nonlinearity Injection
